SWEET CLOVER DEFIES THE DROUGHT

Because sweet clover defies drought, this legume is regarded as one of the most satisfactory to grow for soil improvement purposes in Ohio. At the Ohio Experiment Station, sweet clover has been found to have but one special soil requirement; that is, a sweet soil or one which is plenty of lime in it. Sweet clover is similar to alfalfa in the fact that it is a deep-rooted legume. Specialists regard sweet clover

as quite necessary in farm rotations because it develops a fleshy root which penetrates the subsoil to a depth of at least 3 feet, whereas many of the other legumes are only shallow-rooted crops. The deep-rooting tendency has been found to greatly improve the drainage and deepens the soil effectively.

For a long time sweet clover was regarded as a weed and a pest, but farmers are finding that it is valuable as a hay for livestock and as a pasture for swine.
